

# The Consumer Crypto Stack

The 100x unlock in consumer crypto applications.

# The Problem

Self-custodied crypto experiences have been too hard

- High cognitive overhead
  - Gas, Tokens, Wrapped tokens, Approvals
- Need a wallet
- Desktop-oriented
- Many footguns
  - Seed phrase phishing, malicious signature requests
- Custodial solutions are not the future we want

# The Consumer Crypto Stack's Values

Make crypto experiences accessible to everyone with a phone.

- Self-custody
- Mobile-first
- Application-first
- One-click transactions
- L2-first
- New-to-crypto friendly
- Lazy KYC

# The Consumer Crypto Stack

App wallets, cheap transactions, and mobile notifications

Client

**1. PWA / App**

**2. Smart Contract Wallets**

**3. L2**

Transaction

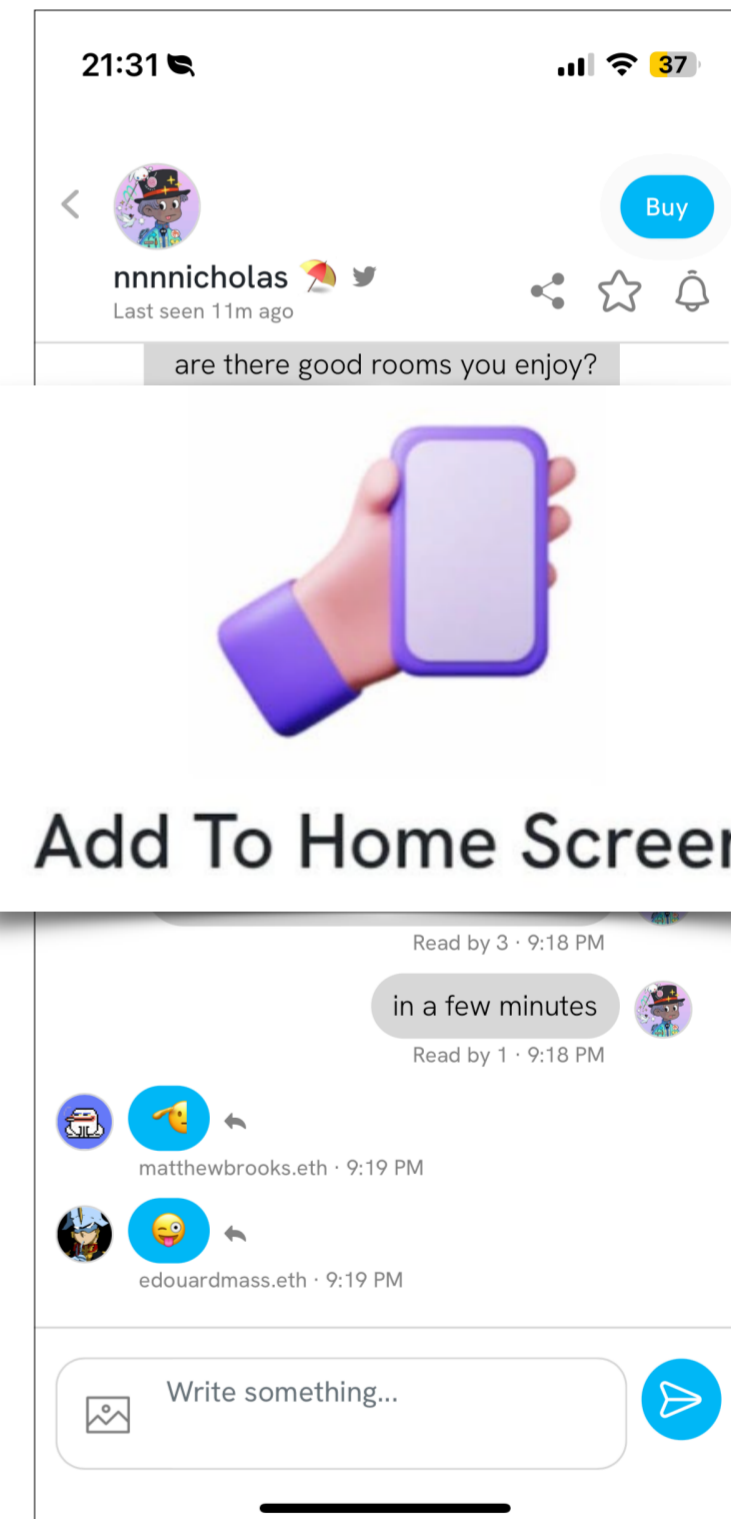

**4. Gasless**

# 1. PWA / App

## Goodbye Discrete Software Wallets (for Most New Users)

- Progressive Web Apps (PWA) on iOS are good now
  - Notifications
  - Home screen icon
- Passkeys available everywhere
  - Private public key pairs generated on-device
  - WebAuthn API in iOS, Android, Windows, Chromium, and Firefox
  - Embedded Passkey signers on AA
  - iCloud Keychain is State of the Art PK backup for 99%
  - Sessions
- EU *Digital Markets Act* will jailbreak iOS in March 2024
  - Sideloaded apps
  - No 30% tax
  - No App Store Guidelines
  - Big Q: How many people will sideload and where?

# 2. Smart Contract Wallets

## Account Abstraction (EIP-4337)

- BYO Authentication
  - Passkeys, Facebook, Gmail, Magic, SMS
  - Rotate signers without moving assets
- New ways to pay gas
  - Pay in an ERC-20
  - Sponsor by MEV, Dapp, or L2 Sequencer
- Tx Bundling
  - E.g. Approve/Swap ERC-20 in one tx
  - Batch send all assets
- Upgradeable (optional)
- Drawbacks
  - Permissions changes don't automatically propagate to every chain
  - Passkeys' secp256r1 verification requires EIP-7212 or MPC DKG EOA

# 4. Gasless

Get transaction cost out of the way of users adoption

- Goal: Delay onramping friction
- Sponsored transactions
  - Paid for by Paymasters, Sequencers, or MEV
- Lazy maxi
  - Offchain orderbook of Intents
  - Paid for by Intent "Taker"

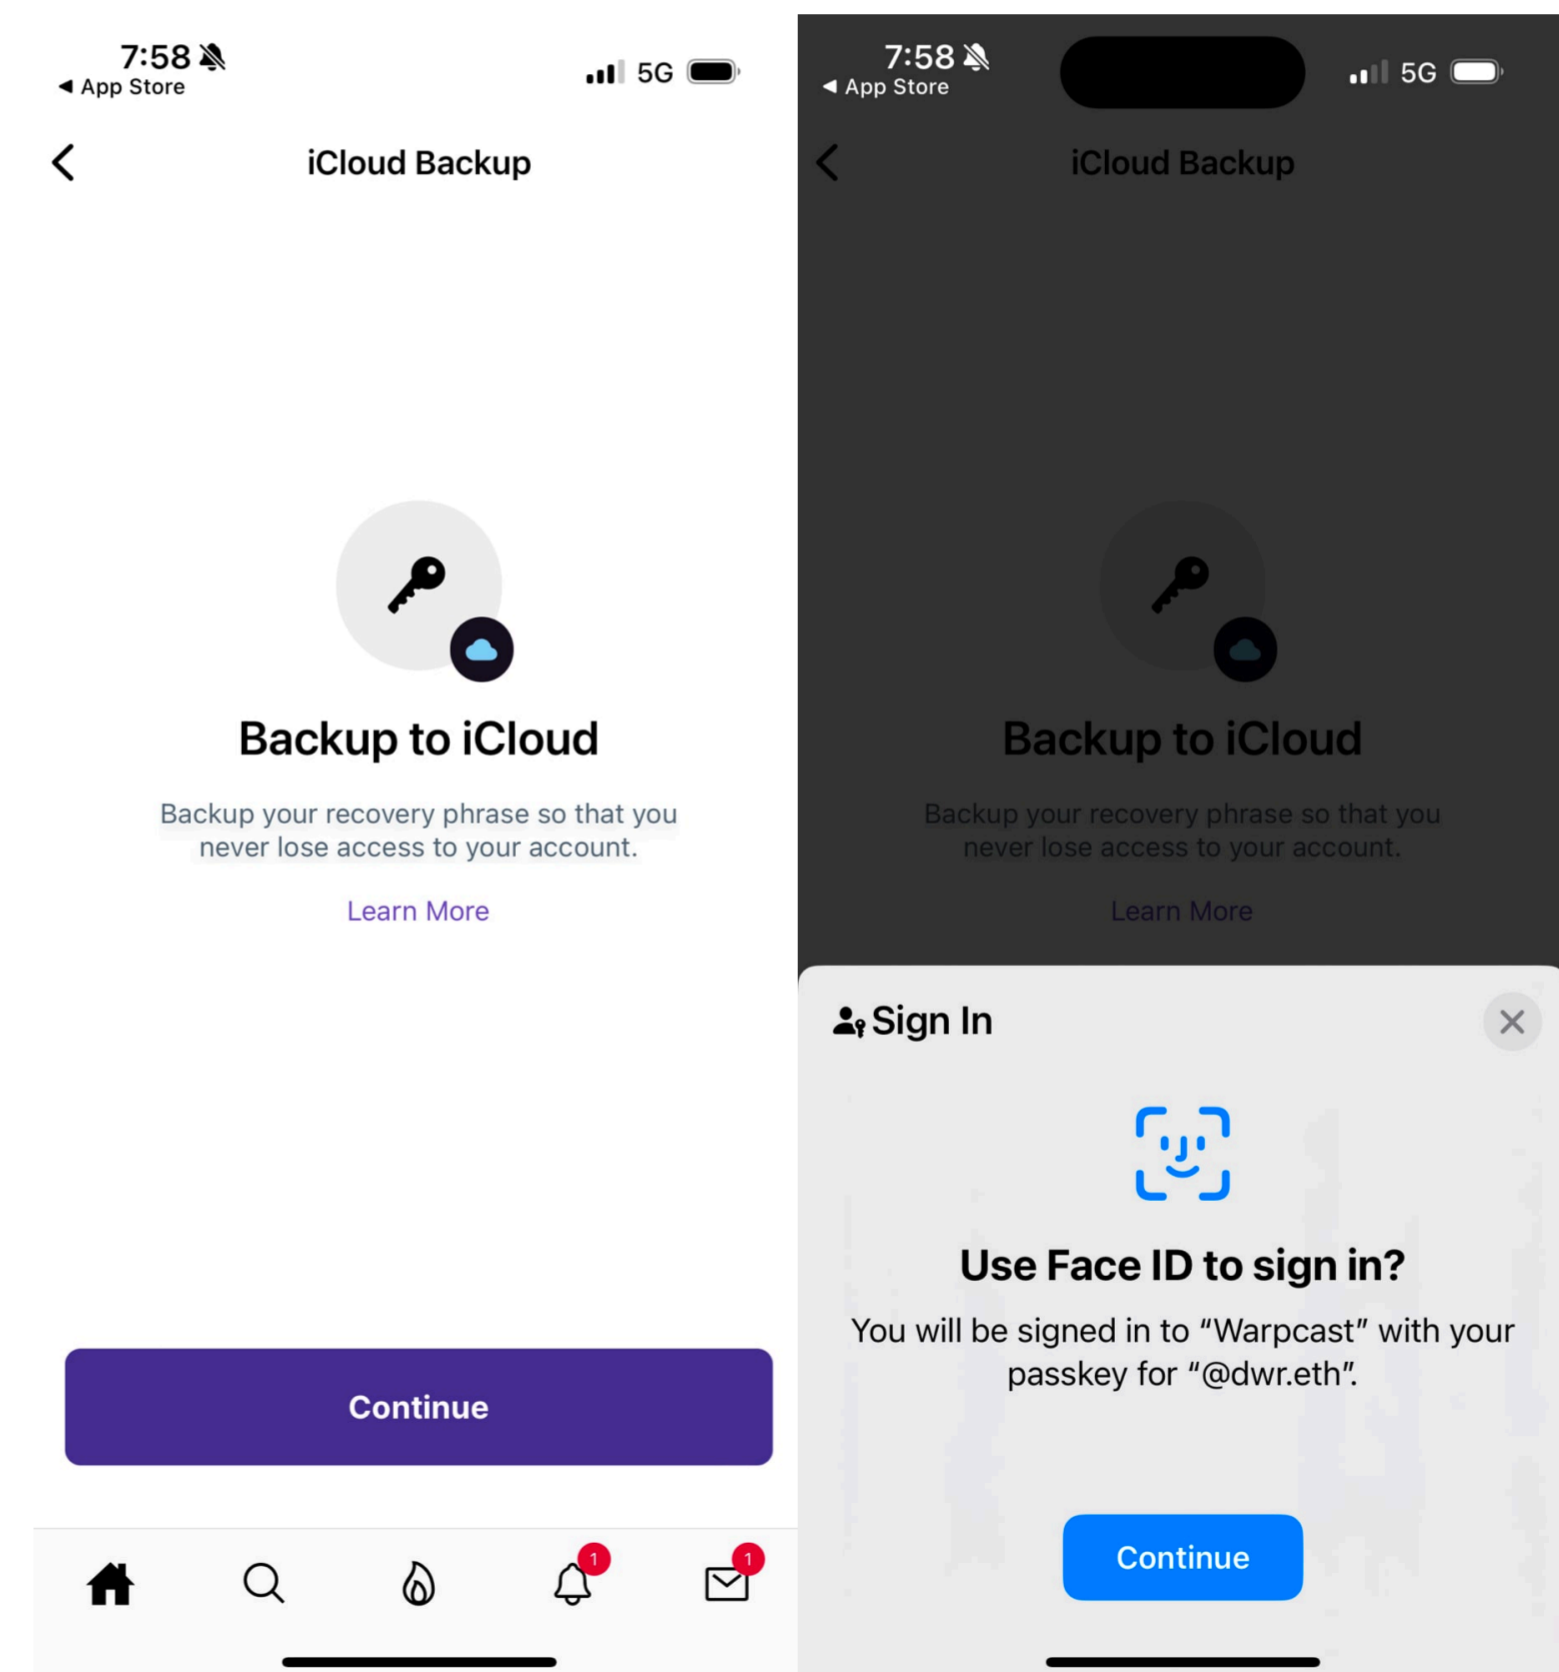

nnnnicholas irl

# Case Study: Warpcast

## Farcast Recovery Phrase in iCloud Keychain

- Sign in with FaceID
- Store Farcaster EOA recovery phrase in largeBlob alongside Passkey
- Passkeys + largeBlob can be backed up to iCloud Keychain
- If user loses their device, they can recover their Farcaster signing key to a new device thanks to iCloud Keychain

# **The Consumer Crypto Stack**

App wallets, cheap transactions, and mobile notifications

- 1. PWA / App**
- 2. Smart Contract Wallets**
- 3. L2**
- 4. Gasless**

# Consumer crypto is here.

I am hiring.
